

### What is Radar?

Radars is a simple and effective way to manage your server requirements. From hardware selection to application deployment, Radar can help you create affordable and efficient server clusters for development, staging and production environments. With a couple of clicks, machines can be rapidly deployed, massively reducing overhead associated with new staff, new projects, or expansion of IT systems.

*“Radars lets us concentrate on projects without worrying about the deployment infrastructure”*

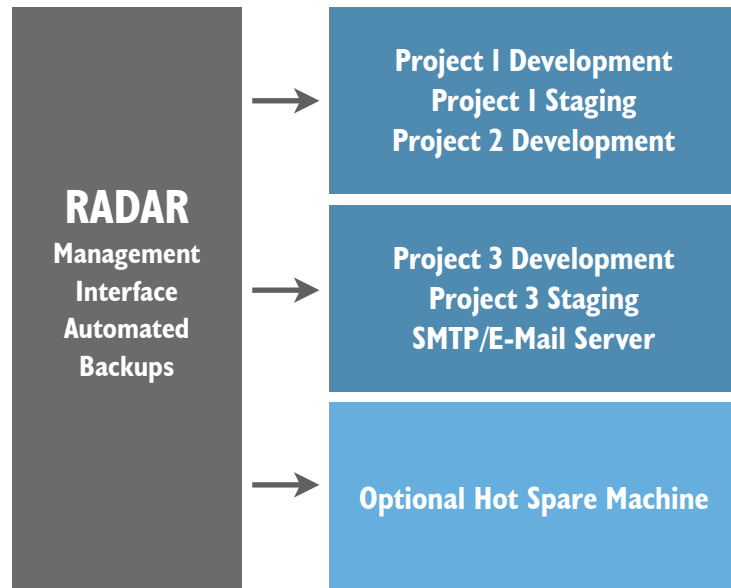

*Adam Cooke, aTech Media.*

### Who can benefit from Radar?

Web based businesses of any size can benefit from Radar's intuitive and rapid deployment of virtual machines. Small businesses can avoid many of the costs associated with maintaining reliable server systems, with the ability to create any server environment quickly and easily. At the same time, highly resilient systems can be created for demanding web application installations. Radar is easily able to grow with your business.

### Save time and money

Our high speed system imaging engine allows you to get new servers up and running in under 5 minutes, pre-configured with the software you need. With dynamically allocated resources, new services can be deployed on existing systems, and hardware upgrades can be implemented without the need for downtime. Virtualization can quickly cut hardware costs, sharing available resources efficiently between virtual systems.

### Features

- **Powerful web based interface** for simple management of systems from any browser
- **Centralized SAN storage** allowing fast and reliable automated backups as well as a high level of resilience provided by RAID technologies
- **Flexible templating system** allowing archiving and duplication of pre-configured systems, as well as easy deployment of a wide range of images available from our library
- **Xen Virtualization technology** for highly efficient use of available hardware
- **High availability features** including automatic failover in case of hardware failure as well as hot migration to allow zero downtime hardware changes
- **Monitoring services** alert you to potential problems with systems as well as providing real-time performance statistics
